
ARS 2.0.1 released

Posted by ronny - 2007/10/02 17:03

On Saturday we released the 2.0.1 update to ARS 2.0.

This fixes the bug resulting in "Invalid argument supplied for foreach()" which occurred in some combinations of PHP and MySQL.

If you didn't spot this error, it is not necessary to do this update.

To update, please uninstall the 2.0 version in your JOOMLA control panel and reinstall the 2.0.1 version of ARS. All necessary changes in database will be done automatically by the install script. Don't simply unzip over an existing installation.

As always, don't forget to backup your database and files!

Happy bookings!
